**Vietnam is among the countries experiencing the most rapid population aging globally.** Between 2015 and 2020, individuals aged 60 and above accounted for over 10% of the national population (Tong (2017)). During the same period, the proportion of those aged 65 and over increased from 6.7% to 7.9%, and this upward trend is projected to continue through 2050 (Nguyen (2021)). By 2038, it is anticipated that older adults aged 60 and above will constitute approximately 20.4% of the total population. Based on current demographic projections, by 2050, Vietnam is expected to have around 29 million people aged 60 and older, representing nearly one-third of the population. Notably, individuals aged 80 and above are projected to comprise at least 6% of the total ([vietnamhelpage2019vietnam?](#)).

# 1 Introduction

This is a book created from markdown and executable code.

See Knuth (1984) for additional discussion of literate programming.
